

Supplementary Figure 3

A - Calibration of the VENUSS score and VENUSS group in predicting recurrence in the ASSURE dataset. The grey line represents the performance of an ideal prognostic model, while the solid lines represent the performance of the VENUSS group, VENUSS score, UISS, TNM and Leibovich 2018 respectively.

B

Smoothed decision curve analysis of the different prognostic models predicting PRCC recurrence. Both the VENUSS score and group showed a net benefit in threshold probabilities exceeding 20%.
